

Python Comments

Python Comments are used to provide extra details about various aspects of a program. They are usually included at the start of a program to indicate its purpose, its author, and the date on which it was written. They also provide clarification about complicated statements in the program.

Python Single-line Comments

The # (hash) is used in Python for single-line comments.

Python Multi-line Comments

The # (hash) can be used in Python for multiline comments. The triple-quoted strings can also be used for multiline comments.

Example

In this example, single and multi-line comments are covered in Python:

```
# Understanding Python Variables
# Code by studyopedia

'''
Variables in Python are reserved
memory locations
'''

# Create a variable
# We are creating a variable with integer value
val = 6;

# Printing the variable value
print("Value = ",val) # displaying the value
```
